

# CASE STUDY

## Bird Wire Installed On Window Sills

**Location:** Chandler, AZ

**Bird Problem:** Large birds locating along the window's ledges create a negative aesthetic for the building.

**Product Installed:** Bird•B•Gone® Bird Wire

**Product Details:** Bird Wire is a post and wire system that creates an unstable landing surface for large birds including both pigeons and gulls. In order to maintain a low profile as well as exclude these larger pest birds, two parallel lines of bird wire were installed along the ledge of the window.

Birds Wire Posts come in various heights to ensure birds will not land.

The Bird Wire is virtually undetectable from inside and outside the building.

The Bird Wire system is a low cost, maintenance free bird deterrent system.

From any angle, Bird Wire blends into the building while keeping the building bird free.
